

PHARMACODYNAMICS

BEOM SOO SHIN, DHAVAL SHAH, AND JOSEPH P. BALTHASAR

University at Buffalo, The State University of New York, Buffalo, New York

Contents

- 1 Introduction
 - 2 Overview
 - 3 “Static” Models of Pharmacological Response
 - 3.1 Drug–Receptor Binding
 - 3.2 E_{\max} Model
 - 3.3 Sigmoid E_{\max} Model (Hill Equation)
 - 4 “Kinetic” Models of Pharmacological Response
 - 4.1 Direct Effect Models
 - 4.2 Indirect Response Models
 - 4.3 Transduction Models
 - 4.4 Irreversible Effects
 - 4.5 Tolerance Models
 - 5 Conclusion
- Acknowledgments

1 INTRODUCTION

Pharmacodynamics refers to the study of relationships between drug concentrations and pharmacological effects. The mathematical description of these relationships, through the use of appropriate *pharmacodynamic models*, facilitates the characterization and comparison of candidate drugs, facilitates the rational selection of appropriate dosing regimens, and assists in the investigation and identification
