

# DOSAGE FORMULATION

ALEXANDER V. LYUBIMOV

*University of Illinois at Chicago, Chicago, Illinois*

## Contents

- 1 Introduction
  - 1.1 Background
  - 1.2 Objectives/Definitions
- 2 General Principles of Dosage Formulation in Preclinical Studies
  - 2.1 Dosage Formulation Preparation
  - 2.2 Role of the Route of Administration
  - 2.3 Role of Absorption/Enhancement of Oral Absorption
  - 2.4 Role of Animal Species
  - 2.5 Protein/Peptide, DNA, Antisense Oligonucleotides (AS-ONs), siRNA, and Other Biological Formulations
  - 2.6 Enhanced Delivery and Semisolid or Sustained Release Preparations (Micronization and Nanoparticles)
  - 2.7 Vehicles and Selection of Excipients
- 3 Types and Characteristics of Dosage Formulations by Route of Administration
  - 3.1 Oral Formulations
  - 3.2 Intravenous and Other Parenteral Formulations
  - 3.3 Alternatives to Parenteral Administration (Nasal, Buccal, Transdermal, Rectal, and Vaginal)
  - 3.4 Topical Formulations for Local Disorders (Dermal, Ocular, Ear)
  - 3.5 Inhalation Formulations (Vapors and Aerosols)
- 4 Conclusion
- References
